Object Constraint Language A definitive guide

Jordi Cabot – AtlanMod / EMN / INRIA /LINA/...
Martin Gogolla – University of Bremen
(with the invaluable help of slides of the BiG group - TUWien)

<http://modeling-languages.com>
@softmodeling

© AtlanMod - atlanmod-contact@mines-nantes.fr

1

Before we start...

- OCL is not sexy and neither are these slides
- Interrupt and participate at any time – No place to hide

© AtlanMod - atlanmod-contact@mines-nantes.fr

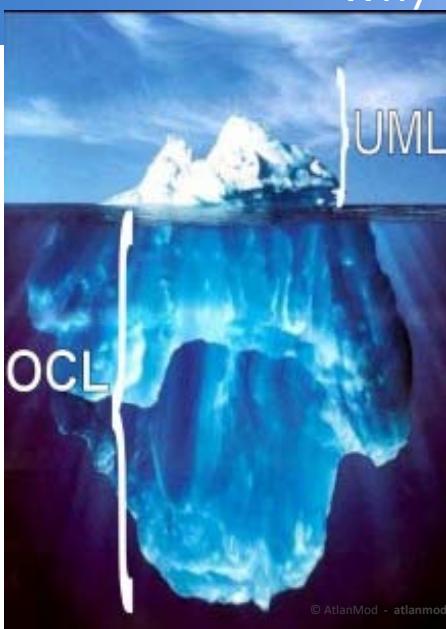

2

WHY OCL?

3

©

Why OCL

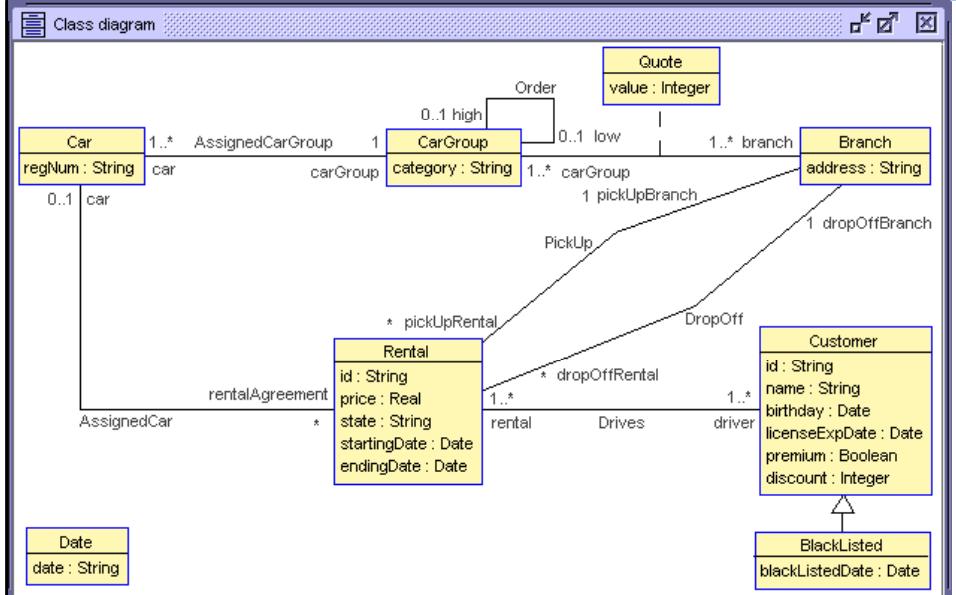

- *No serious use of UML without OCL!!! (limited expressiveness of ALL (graphical) notations)*

© AtlanMod - atlanmod-contact@mines-nantes.fr

4

What does the model NOT say

OCL is everywhere

- Where can we find OCL?
 - Constraints
 - Well-formedness rules
 - Derivation rules
 - Pre/posconditions
 - Guards
 - Model to model transformations
 - Model to text transformations
 - ...

Why OCL

What we say to dogs

Okay, Ginger! I've had it!
You stay out of the garbage!
Understand, Ginger? Stay out
of the garbage, or else!

What they hear

blah blah GINGER blah
blah blah GINGER blah
blah blah GINGER blah
blah blah GINGER blah

© Alain BOUAFIA - alain.bouafia@mines-nantes.fr

- Natural language is clearly not enough

Motivation

- Example 1

```

classDiagram
    Employee {
        age: Integer
    }
    Employee <|--> "Please no underaged employees!"
    Employee -->| "age >= 18"
  
```

e1:Employee age = 17 ✗	e2:Employee age = 37 ✓	e3:Employee alter = 21 ✓
---	---	---

Why OCL - Alternatives to OCL

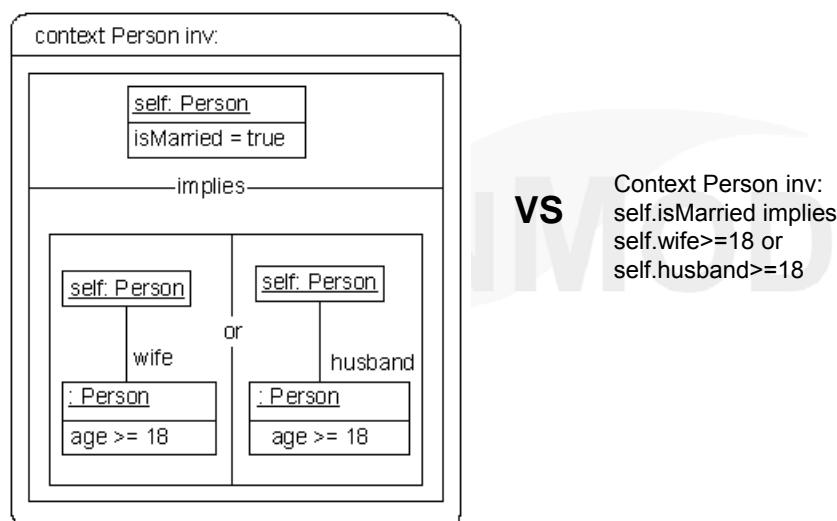

- NL
- FOL
- Alloy
- SQL
- DSLs for specific business rule patterns
- Visual OCL
- SBVR
- ... others?

- You may not like it but right now there is nothing better than OCL!! (and so tightly integrated already with the other existing modeling standards)

© AtlanMod - atlanmod-contact@mines-nantes.fr

9

Why OCL – Visual OCL

© AtlanMod - atlanmod-contact@mines-nantes.fr

10

Why OCL - SBVR

- 'each product belongs to exactly 1 family' is defined as:
 - *The rule is a proposition meant by a necessity formulation.*
 - *... The necessity formulation embeds a universal quantification, u1.*
 - *(3) ... The universal quantification, u1, introduces a first variable, v1.*
 - *(4) ... The variable v1 ranges over the concept 'product'.*
 - *(5) ... The universal quantification, u1, scopes over an exactly one quantification, e1.*
 - *(6) ... The exactly one quantification, e1, introduces a second variable, v2.*
 - *(7) ... The variable, v2, ranges over the concept 'family'.*
 - *(8) ... The exactly one quantification, e1, scopes over an atomic formulation, a1.*
 - *(9) ... The atomic formulation, a1, is based on the fact type 'product belongs to family'.*
 - *(10) ... The atomic formulation, a1, has the first role binding.*
 - *(11) ... The first role binding is of the role 'product'.*
 - *(12) ... The first role binding binds to the variable v1.*
 - *(13) ... The atomic formulation has the second role binding.*
 - *(14) ... The second role binding is of the role 'family'.*
 - *(15) ... The second role binding binds to the variable v2.*

THE LANGUAGE

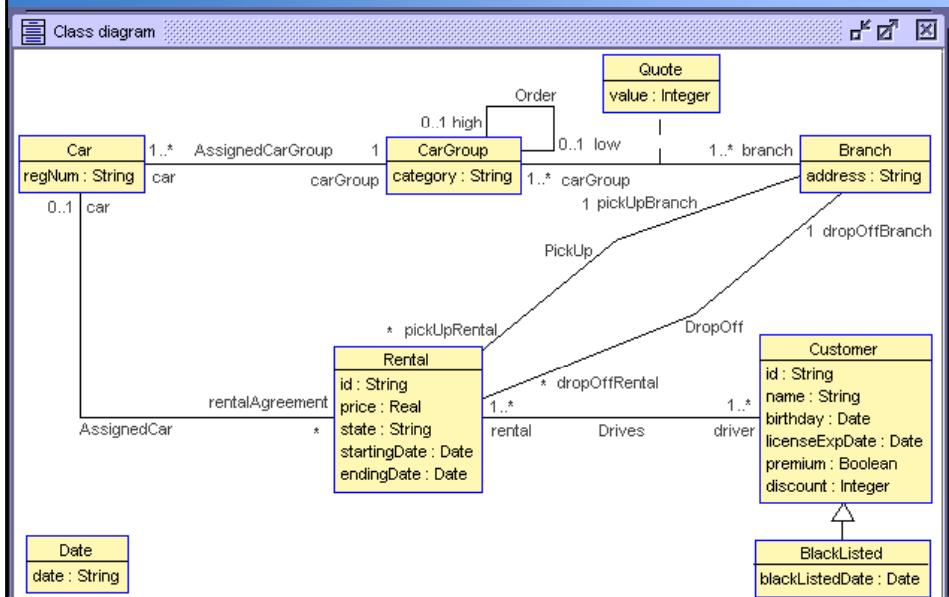

12

©

OCL: Basic Concepts

- OCL is a rich language that offers predefined mechanisms for:
 - Retrieving the values of an object
 - Navigating through a set of related objects,
 - Iterating over collections of objects (e.g., forAll, exists, select)
- OCL includes a predefined standard library: set of types + operations on them
 - Primitive types: Integer, Real, Boolean and String
 - Collection types: Set, Bag, OrderedSet and Sequence
 - Examples of operations: and, or, not (Boolean), +, -, , >, < (Real and Integer), union, size, includes, count and sum (Set).

Some first examples

Some first examples

```
context Quote inv OverZero: self.value > 0
```

```
context BlackListed inv NoRentalsBlackListed:  
self.rental->forAll(r | r.startDate < self.blackListedDate)
```

```
context Customer::premium: boolean init: false
```

Some first examples

```
context Customer::discount: integer  
derive:  
if not self.premium then  
    if self.rental.car.carGroup->  
        select(c|c.category='high')->size()>=5  
    then 15  
    else 0 endif  
else 30 endif
```

Some first examples

```
context Car::mostPopular(): boolean
body:
Car::allInstances()->forAll(c1|c1<>self implies
c1.rentalAgreement->size() <=
    self.rentalAgreement->size())
```

Some first examples

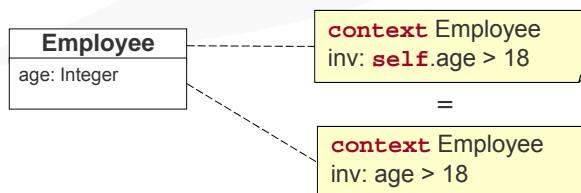

```
context Rental::newRental(id:Integer, price:Real,
startingDate:Date, endingDate:Date, customer:Customer,
carRegNum:String, pickupBranch: Branch, dropOffBranch:
Branch)

pre: customer.licenseExpDate>endingDate

post: Rental.allInstances->one(r |
r.oclIsNew() and r.oclIsTypeOf(Rental) and
r.endingDate=endingDate and r.startingDate=startDate and
r.driver=customer and r.pickupBranch=pickupBranch and
r.dropOffBranch=dropOffBranch and
r.car=Car.allInstances()->any(c | c.regNum=carRegNum))
```

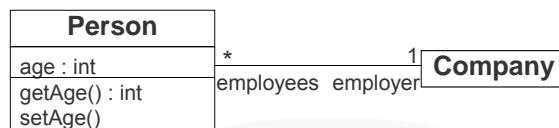

Language syntax: context

- A context has to be assigned to each OCL-statement
 - Starting address – which model element is the OCL-statement defined for
 - Specifies which model elements can be reached using path expressions
- The context is specified by the keyword **context** followed by the name of the model element (mostly class names)
- The keyword **self** specifies the current instance, which will be evaluated by the invariant (context instance).
 - **self** can be omitted if the context instance is unique

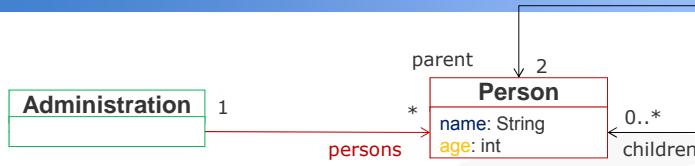

Language syntax: navigation

- Context instance
 - context **Person**
- Accessing attributes
 - **self.age**
- Calling operations
 - Operations must not have **side effects**
 - **self.getAge()**
- Association ends
 - Navigate to the opposite association end using role names
 - **self.employer** – Return value is of type **Company**
 - Navigation often results into a set of objects – Example

■ **What does c.employees.employer return?**

Example 1: Navigation (1)

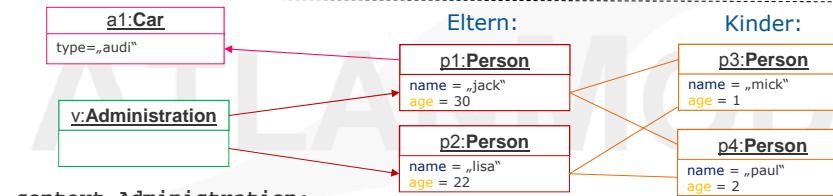

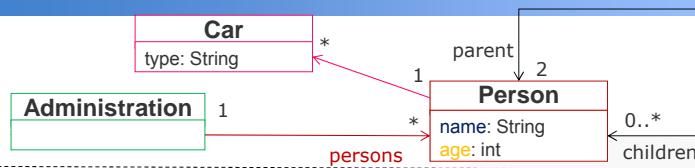

```

context Administration:
  ▪ self.persons      → {Person p1, Person p2}
  ▪ self.persons.name → {jack, lisa}
  ▪ self.persons.age  → {30, 22}
  
```

21

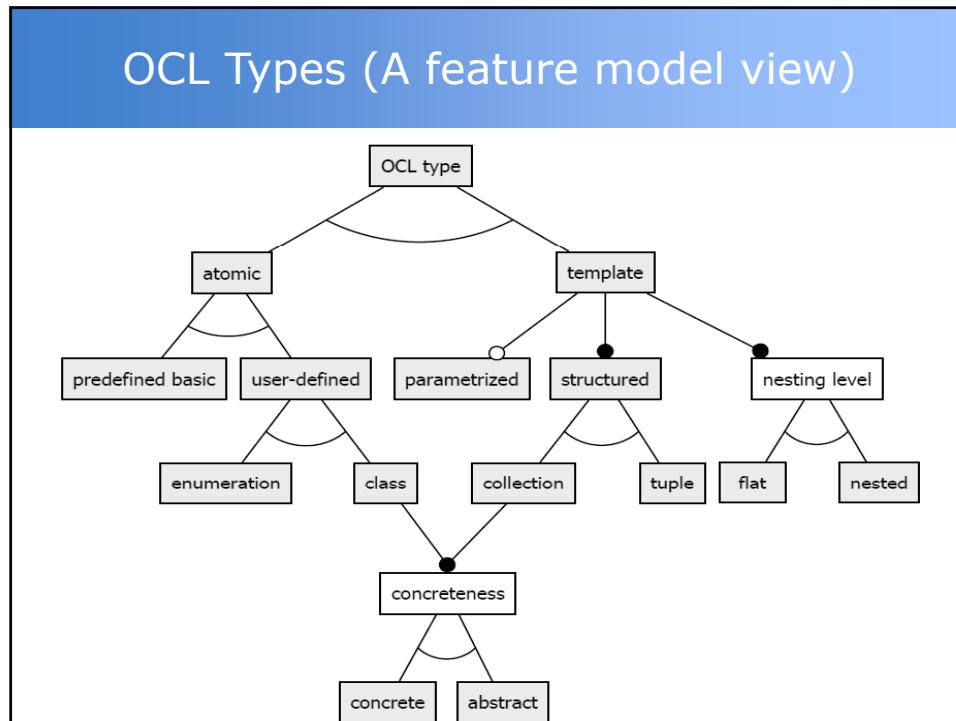

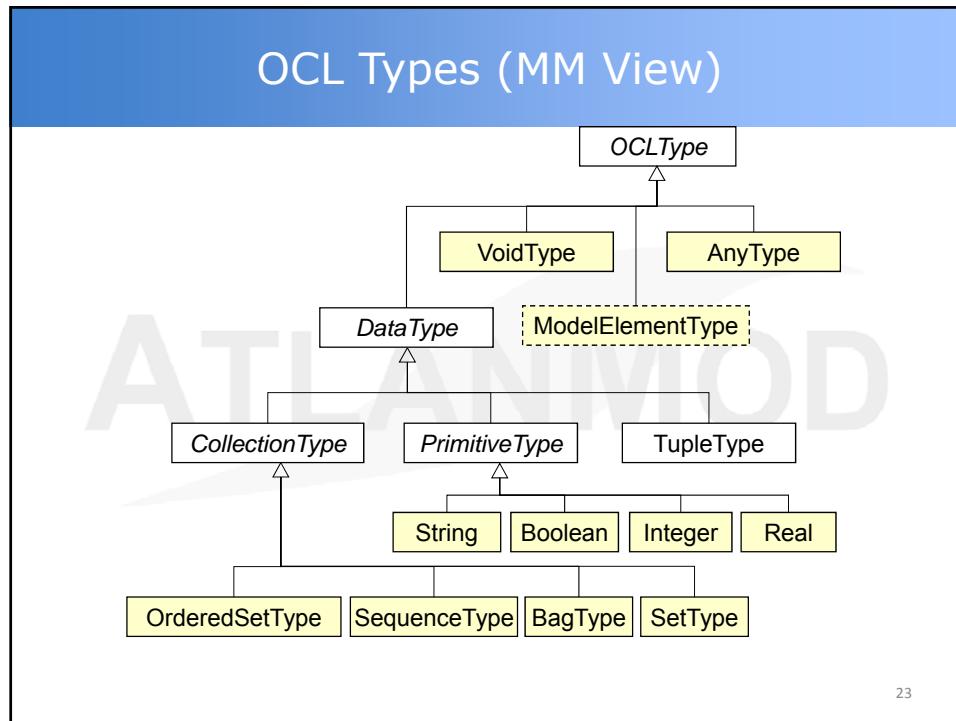

Example 1: Navigation (2)

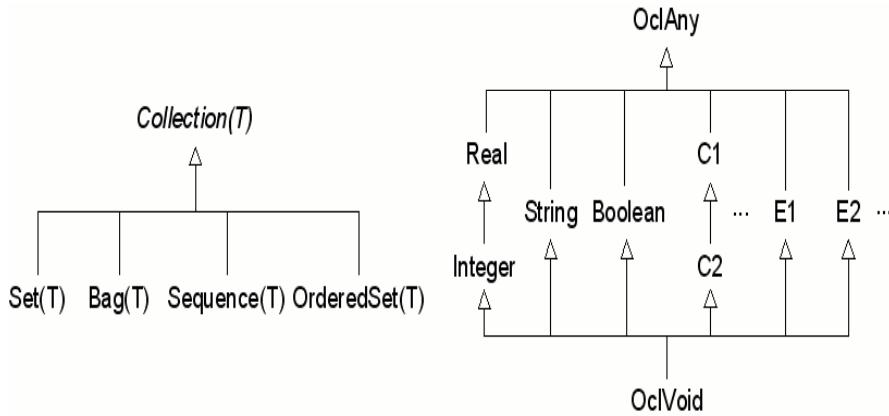

```

context Administration:
  ▪ self.persons.children      → {p3, p4, p3, p4} // returned as flattened bag
  ▪ self.persons.children.parent → {p1, p2, p1, p2, ...}
  ▪ self.persons.car.type       → {"audi"}
  
```

22

Operations for primitive/predefined types

- Note that an **OrderedSet** is not a **Set**!

25

Operations for primitive/predefined types

■ Predefined simple types

- **Integer** {Z}
- **Real** {R}
- **Boolean** {true, false}
- **String** {ASCII, Unicode}

Simple type	Predefined operations
Integer	*, +, -, /, abs(), ...
Real	*, +, -, /, floor(), ...
Boolean	and, or, xor, not, implies
String	concat(), size(), substring(), ...

26

Operations for OclAny

- **OclAny - Supertype** of all primitive types
 - Operations are **inherited** by all other types.

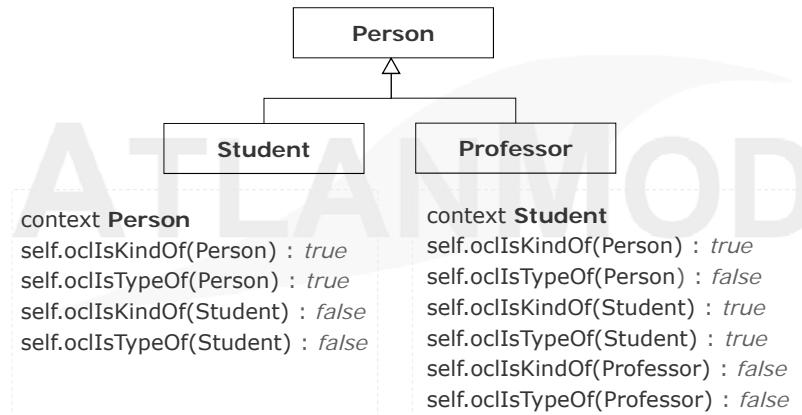

- **Operations of OclAny (extract)**
 - Receiving object is denoted by *obj*

Operation	Explanation of result
<code>=(<i>obj2</i>:OclAny):Boolean</code>	True, if <i>obj2</i> and <i>obj</i> reference the same object
<code>oclIsTypeOf(<i>type</i>:OclType):Boolean</code>	
<code>oclIsKindOf(<i>type</i>:OclType):Boolean</code>	
<code>oclAsType(<i>type</i>:OclType): <i>Type</i></code>	The result is <i>obj</i> of type <i>type</i> , or <i>undefined</i> , if the current type of <i>obj</i> is not <i>type</i> or a direct or indirect subtype of it (casting).

27

Operations for OclAny

- ***oclIsKindOf* vs. *oclIsTypeOf***

- **Can you guess the difference?**

28

OCLVoid

- OCLVoid includes the null value (and therefore all supertypes of OCLVoid)
- Examples

null:OCLVoid
 ada.discount=null : Boolean
 branch42.address=null : Boolean
 1/0=null : Boolean
 (1/0).oclIsUndefined=true : Boolean
 42.oclIsUndefined=false : Boolean
 Set{'800-275-2273','800-694-7466',null} : Set(String)

3-valued logic for OCL

b not(b)	
-----+-----	
null null	
false true	
true false	
b2	b2
b1 or b2 null false true	b1 and b2 null false true
-----+-----	
null null null true	null null false null
b1 false null false true	b1 false false false false
true true true true	true null false true
b2	b2
b1 xor b2 null false true	b1 implies b2 null false true
-----+-----	
null null null null	null null null true
b1 false null false true	b1 false true true true
true null true false	true null false true
b2	b2
b1 = b2 null false true	b1 <> b2 null false true
-----+-----	
null true false false	null false true true
b1 false false true false	b1 false true false true
true false false true	true true true false

Operations for collections

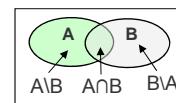

- Collection is an **abstract supertype** for all set types
 - Specification of the **mutual** operations
 - *Set, Bag, Sequence, OrderedSet* inherit these operations
- **Caution:** Operations with a return value of a set-valued type create a new collection (no side effects)
- Syntax: $v \rightarrow op(\dots)$ – Example: $\{1, 2, 3\} \rightarrow size()$

Operation	Explanation of result
<i>size():Integer</i>	Number of elements in <i>coll</i>
<i>includes(obj:OclAny):Boolean</i>	True, if <i>obj</i> exists in <i>coll</i>
<i>isEmpty:Boolean</i>	True, if <i>coll</i> contains no elements
<i>sum:T</i>	Sum of all elements in <i>coll</i> Elements have to be of type Integer or Real

31

Operationen for Set/Bag

- *Set* and *Bag* define additional operations
 - Generally based on **theory of set concepts**
- **Operations of Set (extract)**
 - Receiving object is denoted by set

Operation	Explanation of result
<i>union(set2:Set(T)):Set(T)</i>	Union of <i>set</i> and <i>set2</i>
<i>intersection(set2:Set(T)):Set(T)</i>	Intersection of <i>set</i> and <i>set2</i>
<i>difference(set2:Set(T)):Set()</i>	Difference set; elements of <i>set</i> , which do not consist in <i>set2</i>
<i>symmetricDifference(set2:Set(T)):Set(T)</i>	Set of all elements, which are either in <i>set</i> or in <i>set2</i> , but do not exist in both sets at the same time

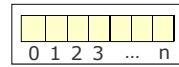

Operations of Bag (extract)

Operation	Explanation of result
<i>union(bag2:Bag(T)):Bag(T)</i>	Union of <i>bag</i> and <i>bag2</i>
<i>intersection(bag2:Bag(T)): Bag(T)</i>	Intersection of <i>bag</i> and <i>bag2</i>

32

Operations for OrderedSet/Sequence

- *OrderedSet* and *Sequences* define additional operations
 - Allow access or modification through an **Index**
- **Operations of OrderedSet** (extract)
 - Receiving object is denoted by *orderedSet*
- **Operations of Sequence**
 - Analogous to the operations of OrderedSet

Operation	Explanation of result
<i>first:T</i>	First element of <i>orderedSet</i>
<i>last:T</i>	Last element of <i>orderedSet</i>
<i>at(i:Integer):T</i>	Element on index <i>i</i> of <i>orderedSet</i>
<i>subOrderedSet(lower:Integer, upper:Integer):OrderedSet(T)</i>	Subset of <i>orderedSet</i> , all elements of <i>orderedSet</i> including the element on position <i>lower</i> and the element on position <i>upper</i>
<i>insertAt(index:Integer,object:T) :OrderedSet(T)</i>	Result is a copy of the <i>orderedSet</i> , including the element <i>object</i> at the position <i>index</i>

33

Iterator-based operations

- OCL defines operations for *Collections* using *Iterators*
 - **Projection** of new *Collections* out of existing ones
 - **Compact declarative specification** instead of imperative algorithms
- Predefined Operations
 - *select(exp) : Collection*
 - *reject(exp) : Collection*
 - *collect(exp) : Collection*
 - *forAll(exp) : Boolean*
 - *exists(exp) : Boolean*
 - *isUnique(exp) : Boolean*
- *iterate(...)* – Iterate over all elements of a *Collection*
 - Generic operation
 - Predefined operations are defined with *iterate(...)*

34

Select / Reject

- **Select** and **Reject** return subsets of collections
 - Iterate over the complete collection and collect elements
- **Select**
 - **Result:** Subset of collection, including elements where *booleanExpr* is **true**
- **Reject**
 - **Result:** Subset of collection, including elements where *booleanExpr* is **false**

collection -> select(v : Type | booleanExp(v))
collection -> select(v | booleanExp(v))
collection -> select(booleanExp)

collection-> reject(v : Type | booleanExp(v))

■ **Do we need a reject operation?**

35

Select operation

context Company inv: *OCCL*
self.employee -> select(e : Employee | e.age>50) -> notEmpty()

Java 5

```
List persons<Person> = new List();
for ( Iterator<Person> iter = comp.getEmployee();
iter.hasNext() ){
    Person p = iter.next();
    if ( p.age > 50 ){
        persons.add(p);
    }
}
```

36

Collect operation

- *Collect-Operation* returns a new collection from an existing one.
 - Result of *collect* always $\text{Bag} < \mathbf{T} >$. \mathbf{T} defines the type of the property to be collected
- Example
 - $\text{self.employees} \rightarrow \text{collect}(\text{age})$ – Return type: $\text{Bag}(\text{Integer})$
- Short notation for collect: $\text{self.employees.age}$

37

Semantics of the Collect operation

context Company inv:
 $\text{self.employee} \rightarrow [\text{collect}(\text{birthdate})] \rightarrow \text{size}() > 3$

```
Java 5
List birthdate<Integer> = new List();
for ( Iterator<Person> iter = comp.getEmployee();
iter.hasNext() ){
    birthdate.add(iter.next().getBirthdate());
}
```

context Company inv:
 $\text{self.employee} \rightarrow [\text{collect}(\text{birthdate})] \rightarrow \text{asSet}()$

Bag
 (with duplicates)

Set
 (without duplicates)

38

Iterator-based operations

- **ForAll** checks, if all elements of a collection evaluate to true. **Example:**

```
collection -> forAll( v : Type | booleanExp(v) )
collection -> forAll( v | booleanExp(v) )
collection -> forAll( booleanExp )
```

- **Nesting** of forAll-Calls (*Cartesian Product*)

context **Company** inv:
 $\text{self.employee} \rightarrow \text{forAll } (\text{e1} \mid \text{self.employee} \rightarrow \text{forAll } (\text{e2} \mid \text{e1} \neq \text{e2} \text{ implies } \text{e1.id} \neq \text{e2.id}))$

- **Alternative**: Use of multiple iterators

context **Company** inv:
 $\text{self.employee} \rightarrow \text{forAll } (\text{e1, e2} \mid \text{e1} \neq \text{e2} \text{ implies } \text{e1.id} \neq \text{e2.id})$

- **Exists** checks, if at least one element evaluates to true
 - $\text{Self.employees} \rightarrow \text{exists}(\text{e: Employee} \mid \text{e.isManager} = \text{true})$

39

Iterate

- **Iterate** is the generic form of all iterator-based operations

- **Syntax**

$\text{collection} \rightarrow \text{iterate}(\text{elem} : \text{Typ}; \text{acc} : \text{Typ} = \langle \text{initExp} \rangle \mid \text{exp}(\text{elem}, \text{acc}))$

- Variable **elem** is a typed *Iterator*
- Variable **acc** is a typed *Accumulator*
 - Gets assigned initial value initExp
- **exp(elem, acc)** is a function to calculate **acc**

- $\text{collection} \rightarrow \text{collect}(\text{x} : \text{T} \mid \text{x.property})$

-- **semantically equivalent to:**

$\text{collection} \rightarrow \text{iterate}(\text{x} : \text{T}; \text{acc} : \text{T2} = \text{Bag}\{\} \mid \text{acc} \rightarrow \text{including}(\text{x.property}))$

40

Iterate

collection -> iterate(x : T; acc : T2 = value | acc -> u(acc, x))

```
iterate (coll : T, acc : T2 = value){ Java 5
    acc=value;
    for( Iterator<T> iter =
        coll.getElements(); iter.hasNext(); ){
        T elem = iter.next();
        acc = u(elem, acc);
    }
}
```

- Example
 - Set{1, 2, 3} -> iterate(i:Integer, a:Integer=0 | a+i)
 - Result: 6

41

Tuple types

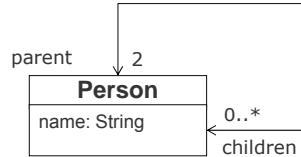

- Tuple types are structured created with the keyword Tuple and by additionally specifying part names and part values.
- Tuples and collections are orthogonal

```
Set{Tuple{name:'Ada',emails:Set{'ada@acm','ada@ibm'
    }},Tuple{name:'Bob',emails:Sequence{'bob@omg','bo
    b@sun'}}} :
```

```
Set(Tuple(emails:Collection(String),name:String))
```

42

Example : Alternative, equivalent OCL-formulations

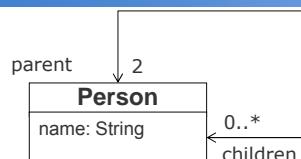

Constrain: A person is not its own child

- *How many different formulations can you find?*

43

Example 5: Alternative, equivalent OCL-formulations (1)

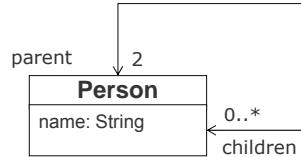

Constrain: A person is not its own child

- `(self.children->select(k | k = self))->size() = 0`
The Number of children for each person „self“, where the children are the person „self“, have to be 0.
- `(self.children->select(k | k = self))->isEmpty()`
The set of children for each person „self“, where the children are the person „self“, has to be empty.

44

Example 5: Alternative, equivalent OCL-formulations (2)

Constrain: A person is not its own child

- `not self.children->includes(self)`

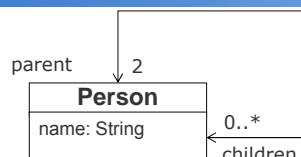

It is not possible, that the set of children of each person „self“ contains the person „self“.

- `self.children->excludes(self)`

The set of children of each person „self“ cannot contain „self“.

45

Example 5: Alternative, equivalent OCL-formulations (3)

Constrain: A person is not its own child

- `Set{self}->intersection(self.children)->isEmpty()`

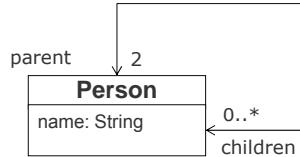

The intersection between the one element set, which only includes one person „self“ and the set of the children of „self“ has to be empty.

- `(self.children->reject(k | k <> self))->isEmpty()`

The set of children for each person „self“, for whom does not apply, that they are not equal to the person „self“, has to be empty.

46

Example 5: Alternative, equivalent OCL-formulations (4)

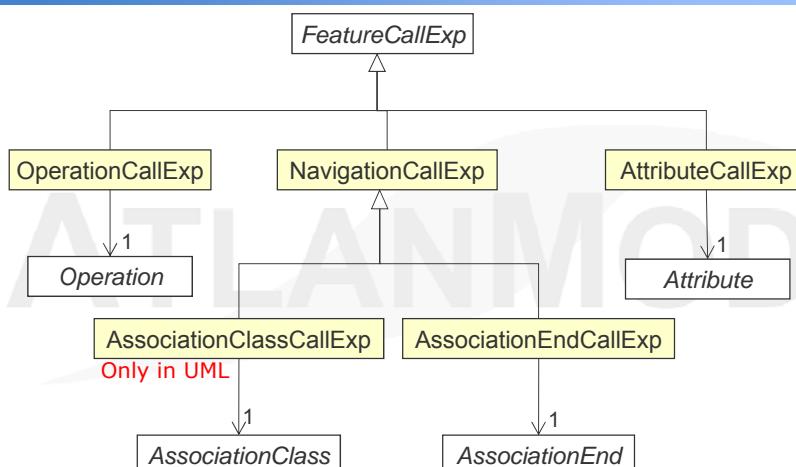

Constrain: A person is not its own child

- `self.children->forAll(k | k <> self)`
Each child of the person „self“ is not the person „self“.
 - `not self.children->exists(k | k = self)`
There is no child for each person „self“, which is the person „self“
- *Having so many ways to express each constraint is good or bad?*

47

OCL Metamodel (expressions)

An OCL expression as an instance of the OCL MM

```

context Category inv: self.customer->forAll(c| c.sale->
select(paymentDate>now) :IteratorExp (forAll) ()<=self.maxPendingAmount)
      |
      +--> :AssociationEndCallExp (customer)
      +--> :OperationCallExp (<=)
      |
      +--> :VariableExp (self)
      +--> :OperationCallExp (sum)
      +--> :AttributeCallExp (maxPendingAmount)
      |
      +--> :AttributeCallExp (amount)
      |
      +--> :IteratorExp (select)
      |
      +--> :AssociationEndCallExp (sale)
      +--> :OperationCallExp (<=)
      |
      +--> :VariableExp (c)
      +--> :AttributeCallExp (paymentDate)
      +--> :OperationCallExp (now)
  
```

BIG  

SO YOU THINK YOU KNOW OCL...

allInstances

- Car::allInstances () : Set(Car)
- String::allInstances() : Set(String) ???

ATLANMOD

- *Careful with the allInstances operation. Do not apply on infinite types!*

Null values

- 0<>null ?
- “<>null ?
- ‘null’<>null ?
- ‘NULL’<>null ?
- ‘Null’<>null ?

- *All true, null is a value different from all the others*

Collections

$\begin{array}{ccc} \text{Set}\{7,8\} & = & \text{Set}\{8,7\} \\ \backslash & & / \\ = & & = \\ \backslash & / \\ \text{Set}\{7,8,7\} & & \end{array}$

 $\begin{array}{ccc} \text{OrderedSet}\{7,8\} & \leftrightarrow & \text{OrderedSet}\{8,7\} \\ \backslash & & / \\ = & & \leftrightarrow \\ \backslash & / \\ \text{OrderedSet}\{7,8,7\} & & \end{array}$

$\begin{array}{ccc} \text{Bag}\{7,8\} & = & \text{Bag}\{8,7\} \\ \backslash & & / \\ \leftrightarrow & & \leftrightarrow \\ \backslash & / \\ \text{Bag}\{7,8,7\} & & \end{array}$

 $\begin{array}{ccc} \text{Sequence}\{7,8\} & \leftrightarrow & \text{Sequence}\{8,7\} \\ \backslash & & / \\ \leftrightarrow & & \leftrightarrow \\ \backslash & / \\ \text{Sequence}\{7,8,7\} & & \end{array}$

Collections

- Sets are insensible to insertion order and frequency
- Ordered Sets are sensible to order, insensible to frequency
- Bags are sensible to frequency, insensible to order
- Sequences are sensible to both

Examples of Collections

- $\text{Set}\{7,8\} = \text{Set}\{\} \rightarrow \text{including}(8) \rightarrow \text{including}(7)$
- $\text{Bag}\{7,8,7\} = \text{Bag}\{8\} \rightarrow \text{including}(7) \rightarrow \text{including}(7)$
- $\text{Sequence}\{7,8,7\} = \text{Sequence}\{7,8\} \rightarrow \text{including}(7)$
- $\text{OrderedSet}\{7,8\} = \text{OrderedSet}\{7\} \rightarrow \text{including}(8) \rightarrow \text{including}(7)$
- $\text{Set}\{7,8\} \rightarrow \text{excluding}(8) = \text{Set}\{7\}$
- $\text{Bag}\{7,8,7\} \rightarrow \text{excluding}(7) = \text{Bag}\{8\}$
- $\text{Sequence}\{7,8,7\} \rightarrow \text{excluding}(7) = \text{Sequence}\{8\}$
- $\text{OrderedSet}\{9,6,7,8,6,7\} \rightarrow \text{excluding}(6) = \text{OrderedSet}\{9,7,8\}$

Collection Casting

- Some ambiguous conversions
- $\text{Sequence}\{8,7,7,8\} \rightarrow \text{asSet()} = \text{Set}\{7,8\}$:
- $\text{Sequence}\{8,7,7,8\} \rightarrow \text{asBag()} = \text{Bag}\{7,7,8,8\}$
- $\text{Set}\{8,7,7,8\} \rightarrow \text{asSequence}()$
 $\quad ? \text{ Sequence}\{7,8\}$
 $\quad ? \text{Sequence}\{8,7\}$

- *Implementator's decision!!*
 - *Also others like :*
 - *$\text{Set}\{7,8,9\} \rightarrow \text{any(true)}$*

Collection Equality

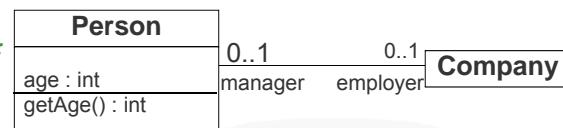

- $\text{Set}\{7,8\} = \text{Set}\{8,7,7\}$
- $\text{Set}\{7,8\} = \text{Bag}\{7,8\}$ ✘
- $\text{OrderedSet}\{8,9\} = \text{Sequence}\{8,9\}$ ✘
- $\text{OrderedSet}\{7,8,8\} = \text{OrderedSet}\{7,8,7\}$
- $\text{OrderedSet}\{7,9,8\} = \text{OrderedSet}\{9,7,8\}$ ✘

© AtlanMod - atlanmod-contact@mines-nantes.fr

57

Invariants with undefined

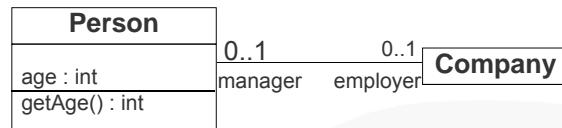

- *Context Company inv:*
 $\text{Self.manager.age} > 18$

- Constraints are violated if they do not evaluate to true
 - Companies with a manager with age undefined will violate the constraint
 - What would happen in SQL?

58

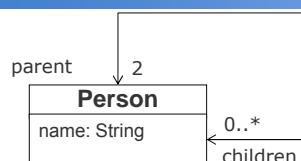

Invariants with undefined (2)

- *Context Company inv: Self.manager.age>18*
- We need to check for undefinedness
 - If not self.manager.oclIsUndefined then self.manager.age>18
- *Or, Context Company inv: Self.manager->forAll(age>18)*
- *Why??*

59

Recursive OCL queries

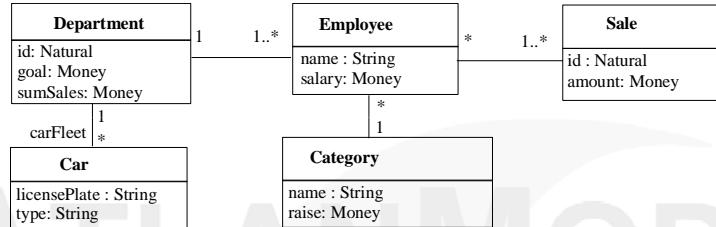

Constrain: A person cannot be his own ancestor

- Context Person inv:
self->asSet()->closure(children)
- Closures added in the last version of OCL

60

OCL in postconditions (frame problem also in OCL)

Employees have sold enough to fulfill the goal. Their salary is increased as indicated by their category. Otherwise, employees are not longer allowed to use luxury cars

```

context Department::GoalEvaluation()
post: self.sumSales=self.employee.sales.amount->sum() and
      if self.sumSales>self.goal then
          self.employee->forAll(e| e.salary= e.salary@pre + e.category.raise)
      else self.carFleet->excludesAll(Car.allInstances->select(c| c.type='Luxury'))
      endif
  
```

(MISSING) OCL LIBRARIES

Extending OCL 1 – Aggregation functions

- Extension classified in three different groups of functions:
 - Distributive functions: can be defined by structural recursion
 - **Max, min, sum, count, count distinct,...**
 - Algebraic functions: finite algebraic expressions over distributive functions
 - **Avg, variance, stddev, covariance, ...**
 - Holistic functions: the rest
 - **Mode, descending rank, ascending rank, percentile, median**

■ *These operations can be combined to provide more advanced ones (e.g. top(x) that is implemented using rank). See Jordi Cabot, Jose-Norberto Mazón, Jesús Pardillo, Juan Trujillo: Specifying Aggregation Functions in Multidimensional Models with OCL. ER 2010: 419-432*

Some examples (1/3)

- MAX: Returns the element in a non-empty collection of objects of type T with the highest value.

```
context Collection::max():T
pre: self->notEmpty()
post: result = self->any(e | self->forAll(e2 | e >= e2))
```

- COUNT DISTINCT: Returns the number of different elements in a collection

```
context Collection::countDistinct(): Integer
post: result = self->asSet()->size()
```

Some examples (2/3)

- **AVG:** Returns the arithmetic average value of the elements in the non-empty collection.
- ```
context Collection::avg():Real
pre: self->notEmpty()
post: result = self->sum() / self->size()
```
- **COVARIANCE:** Returns the covariance value between two ordered sets

```
context OrderedSet::covariance(Y: OrderedSet):Real
pre: self->size() = Y->size() and self->notEmpty()
post:
 let avgY:Real = Y->avg() in
 let avgSelf:Real = self->avg() in
 result = (1/self->size()) *
 self->iterate(e; acc:Real=0 | acc +
 ((e - avgSelf) * (Y->at(self->indexOf(e)) - avgY)))
```

## Some examples (3/3)

- **MODE:** Returns the most frequent value in a collection.
- ```
context Collection::mode(): T
pre: self->notEmpty()
post: result = self->any(e | self->forAll(e2 |
    self->count(e) >= self->count(e2)))
```
- **DESCENDING RANK:** Returns the position (i.e., ranking) of an element within a Collection.

```
context Collection::rankDescending(e: T): Integer
pre: self->includes(e)
post: result = self->size() - self->select(e2 | e>=e2
    ->size() + 1
```

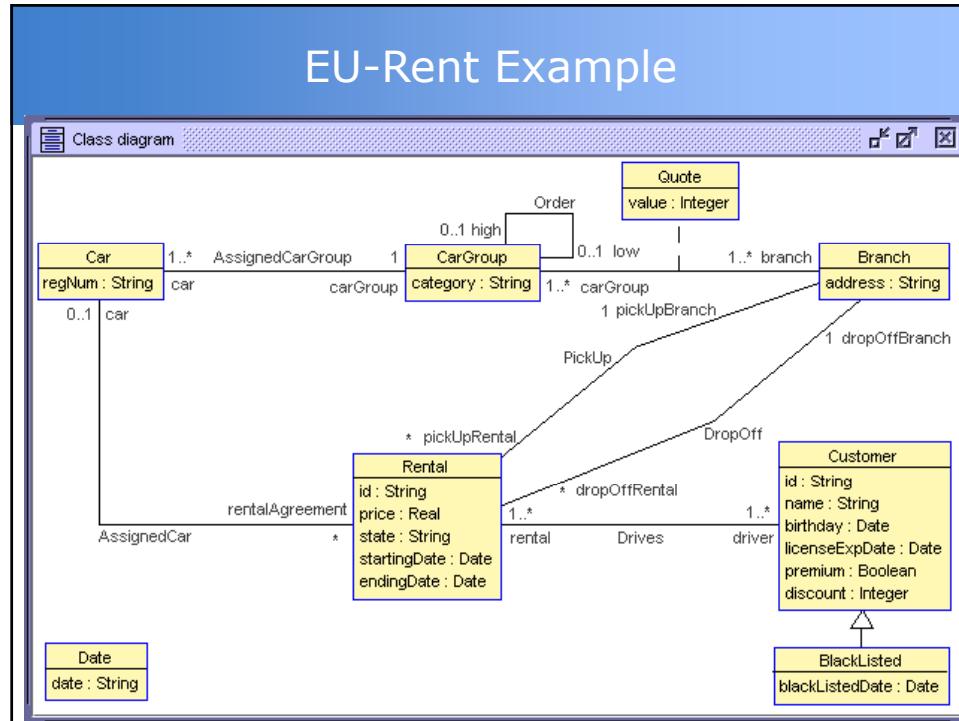

Using our new aggregate functions

- Our functions can be used wherever a OCL standard function can be used
- They are called exactly in the same way
- Ex of use of the *avg* function to compute the average number of miles earned by a customer in each flight leg.

```
context Customer::avgPriceRental():Real
body: self.drives.price->avg()
```

OCL and Time

- OCL has serious limitations to express time-related constraints
 - Date and time datatypes are not even part of the OCL standard!!
- But time/date/calendar related constraints are very common in data-intensive applications
- Some works on extending OCL with temporal logic but we need much more than this

OCL and Time

- Examples of useful constraints (can we express them in OCL?)
 - Rental ending date must be later or equal than starting date
 - On Mondays the agency is close (so no rentals starting on a Monday)
 - Minimum duration of a rental is 10 hours
 - Same customer cannot rent twice in the same week
 - Last Friday of each month the agency is closed

OCL and Time

- I'd like to be able to write things like:
 - Context Rental inv:
self.startingdate<=self.endDate
 - Context Rental inv: not
self.startingDate.dayOfTheWeek()<>DayOftheWeek::Monday
 - Context Rental inv: (self.endDate - self.startingDate).hours()>=10
 - Context rental inv : not
self.startingdate=self.startingdate.getMonth().last('Friday')

Modularizing OCL

- OCL needs a modularization mechanism to extend the basic library with domain-specific ones created by experts

TOOLS – OCL IDES

74

©

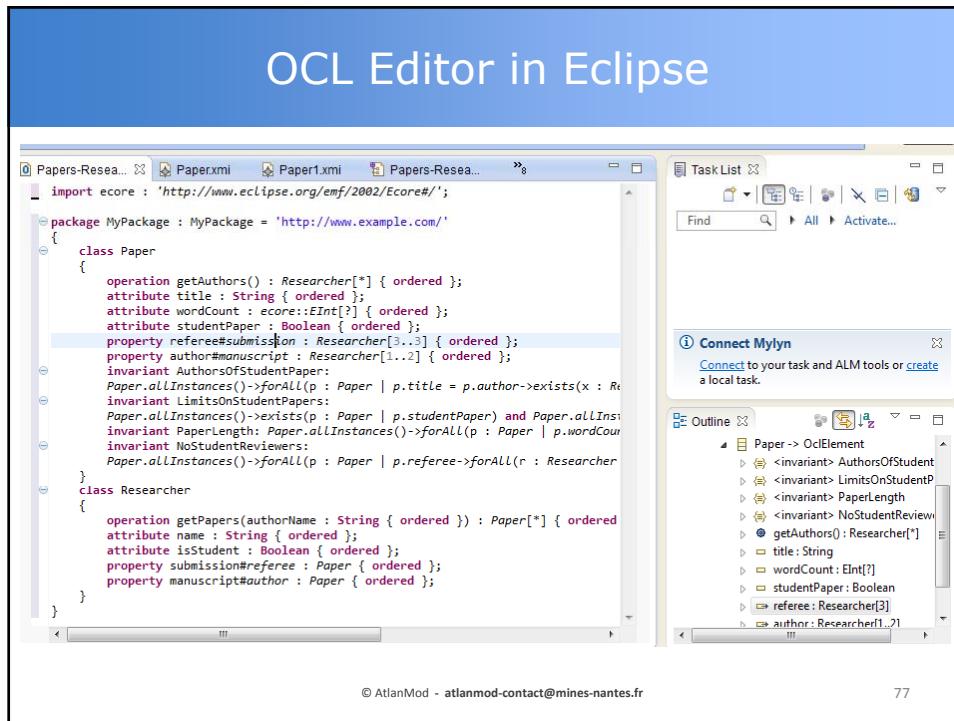

Desired Features of a OCL tool IDE

- List of features you'd like:

■ Joanna Dobrosława Chimiak-Opoka, [Birgit Demuth: A Feature Model for an IDE4OCL. ECEASST 36: \(2010\)](#)

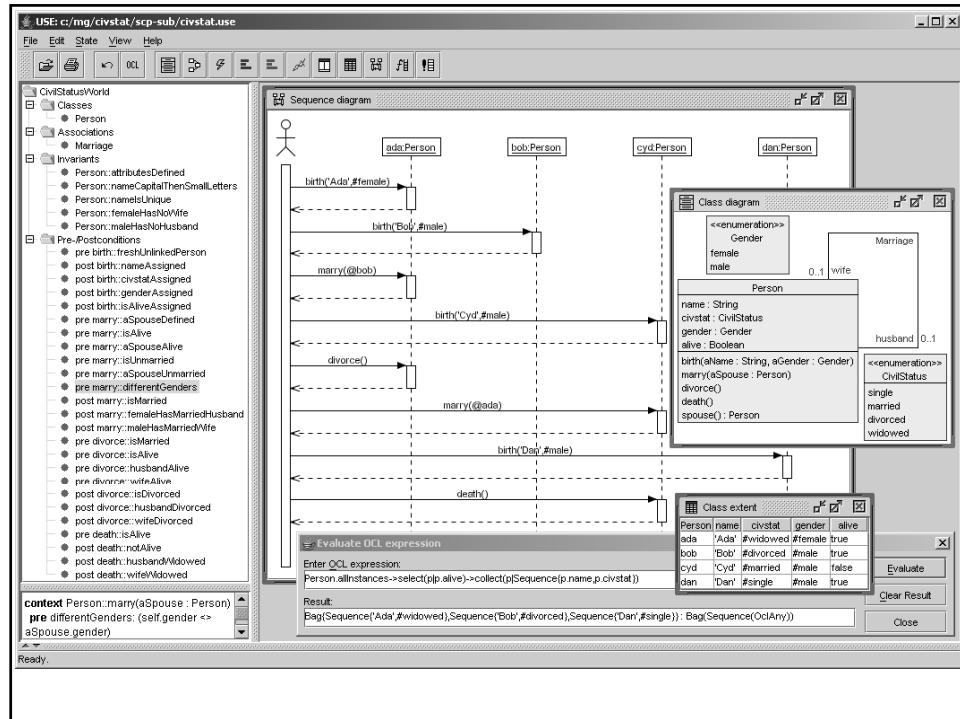

Desired Features of a OCL tool IDE

- Main active IDEs
 - MDT/OCL component
 - Dresden OCL
 - USE tool
- OCL support also in some UML tools like ArgoUML, Enterprise Architect, MagicDraw...

USE tool

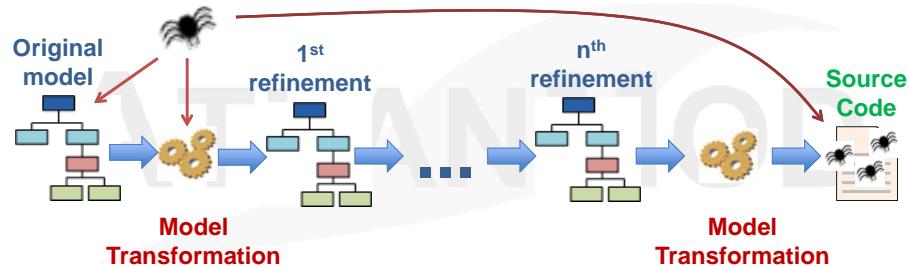

- USE allows to
 - Perform UML and OCL model animation, validation and verification
 - Evaluate OCL expressions
 - Get confidence in models (formal descriptions) by testing it with scenarios
 - Check consistency of models by constructing an object diagram
 - Show independency of invariants (no invariant follows from the others)
 - Check whether a property follows from other stated constraints
 - Construct a large amount of object diagrams through an ASSL program (A Snapshot Sequence Language)

TOOLS – ANALYZING OCL

Why model verification?

MDE-based software development process

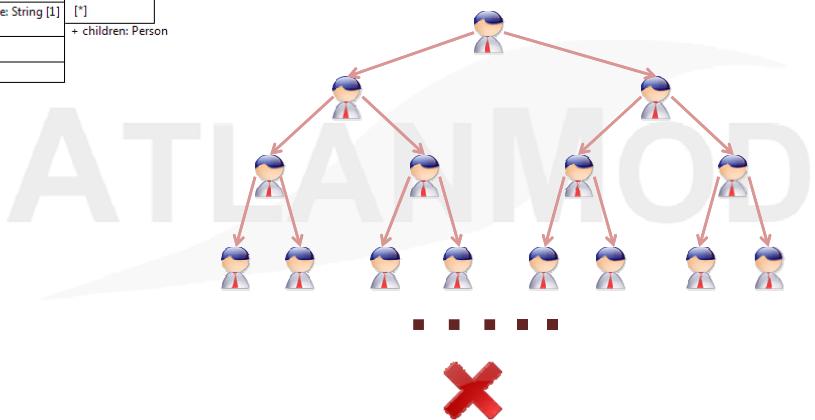

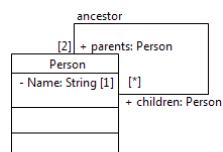

Errors in models will lead to errors in
the resulting software

© AtlanMod - atlanmod-contact@mines-nantes.fr

81

How models are verified?

A Person cannot be his own ancestor

© AtlanMod - atlanmod-contact@mines-nantes.fr

82

What properties do you find useful?

- For static models?
- For dynamic ones? (including transformations)

© AtlanMod - atlanmod-contact@mines-nantes.fr

83

Properties for static models

“It should be possible to instantiate...”

Strong SAT	≈	Every class and association
Weak SAT	≈	Some class of the model
Liveliness	≈	A specific class

“Given two constraints C1 and C2 ...”

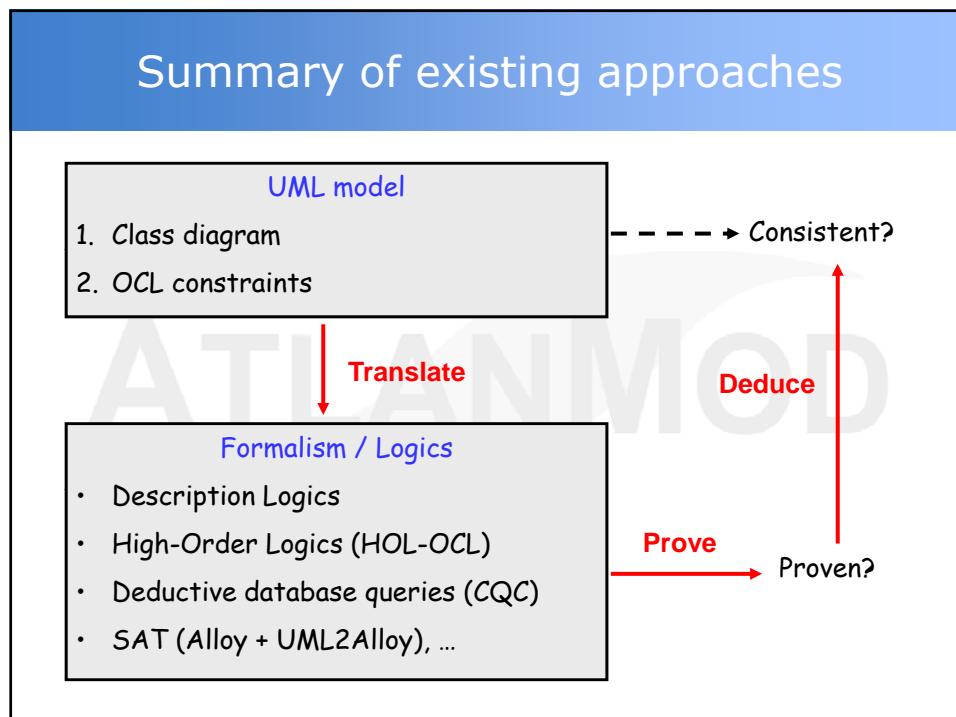

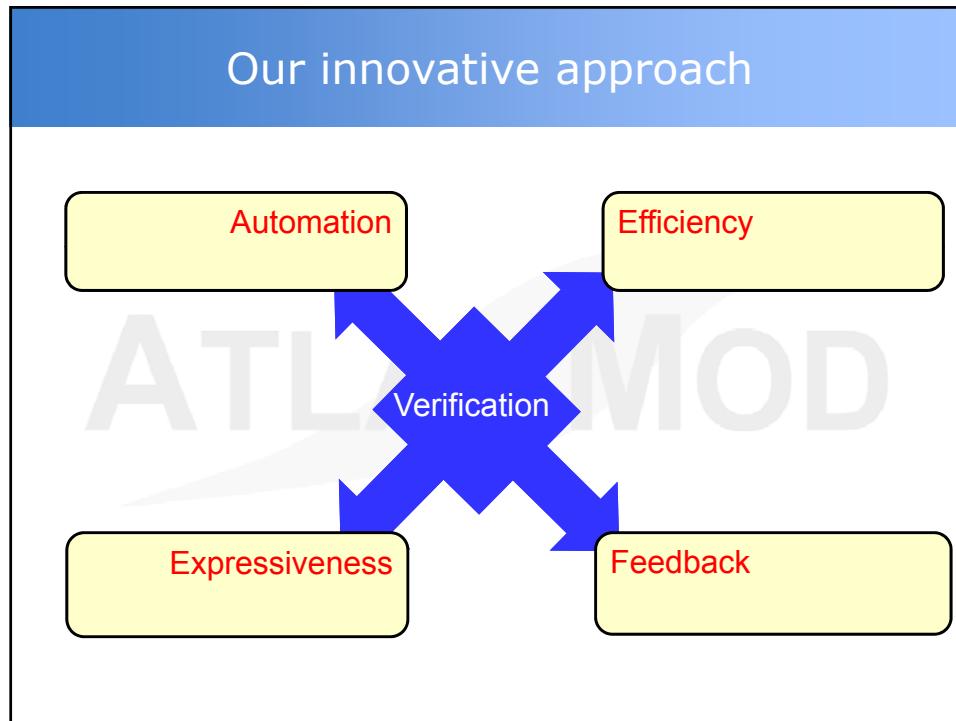

No subsumption	≈	C1 does not imply C2
No redundancy	≈	C1 & C2 are not redundant

And for dynamic ones

Applicability ≈ Is it possible to execute the operation/transformation
(weak/strong) Executability ≈ Is the generated target model correct?
Determinism ≈ Given a source model there's only a possible target model?
Injective (and same with all other functional categories) ≈ Is each target model the result of a single source model?

The problem of undecidability

- The expressiveness of modeling languages and the OCL represents an important setback at the time of checking correctness properties.
- Verification techniques usually run into decidability issues when checking correctness properties
- A typical example of this is checking strong satisfiability in UML class diagrams complemented with generic OCL constraints.

EMFtoCSP Features

- **Supports**

Verification of EMF models + OCL

Verification of UML Class Diagrams + OCL

- **Pragmatic Approach**

Model and constraints are converted into a CSP

Decidability

Bounded Verification

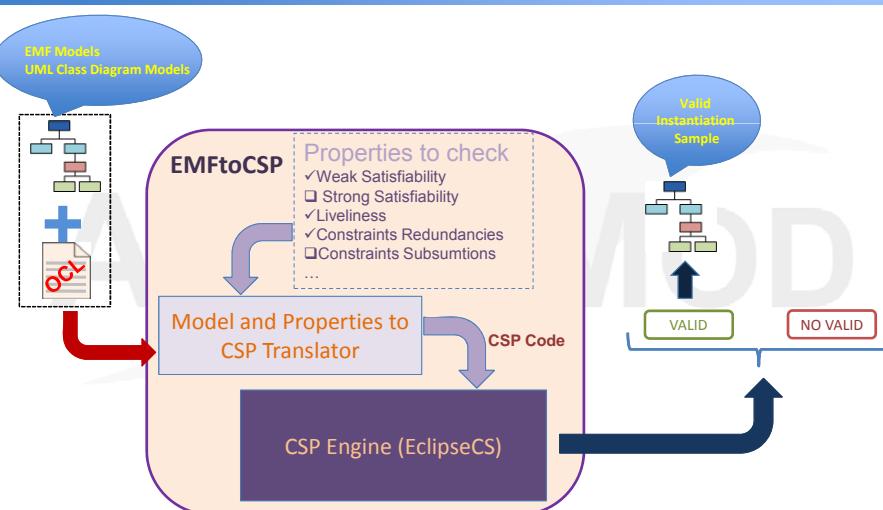

- **Implementation**

Made for Eclipse

89

EMFtoCSP: A General Picture

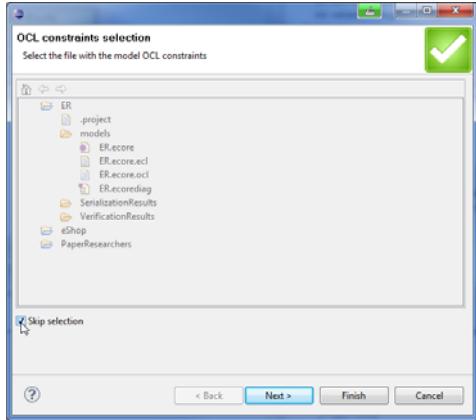

© AtlanMod - atlanmod-contact@mines-nantes.fr

90

Using EMFtoCSP (II)

**Step 1
OCL Selection**

It allows to load OCL constraints from a separate ".ocl" file.

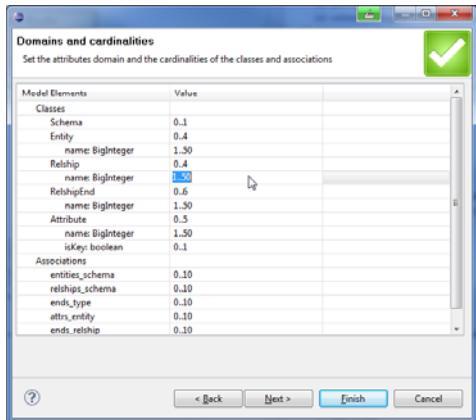

© AtlanMod - atlanmod-contact@mines-nantes.fr 91

Using EMFtoCSP (III)

**Step 2
Setting domains and cardinalities**

To limit the search space where to look for a valid instance of the model.

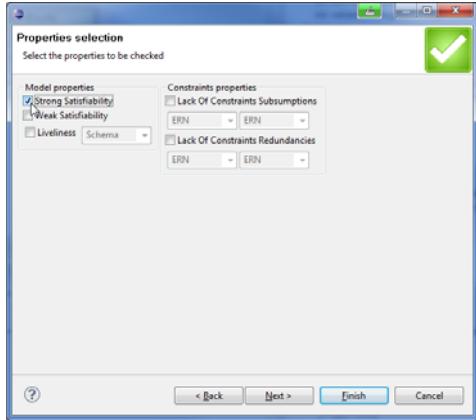

© AtlanMod - atlanmod-contact@mines-nantes.fr 92

Using EMFtoCSP (IV)

**Step 3
Selecting the properties to be checked**

Some properties can only be checked when the model includes OCL constraints.

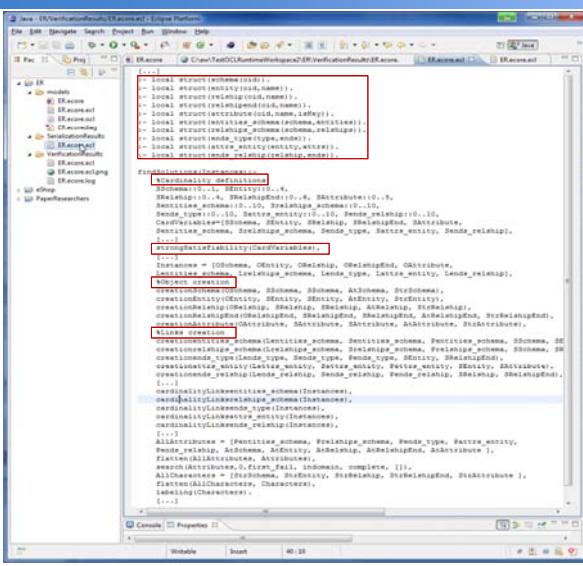

© AtlanMod - atlanmod-contact@mines-nantes.fr 93

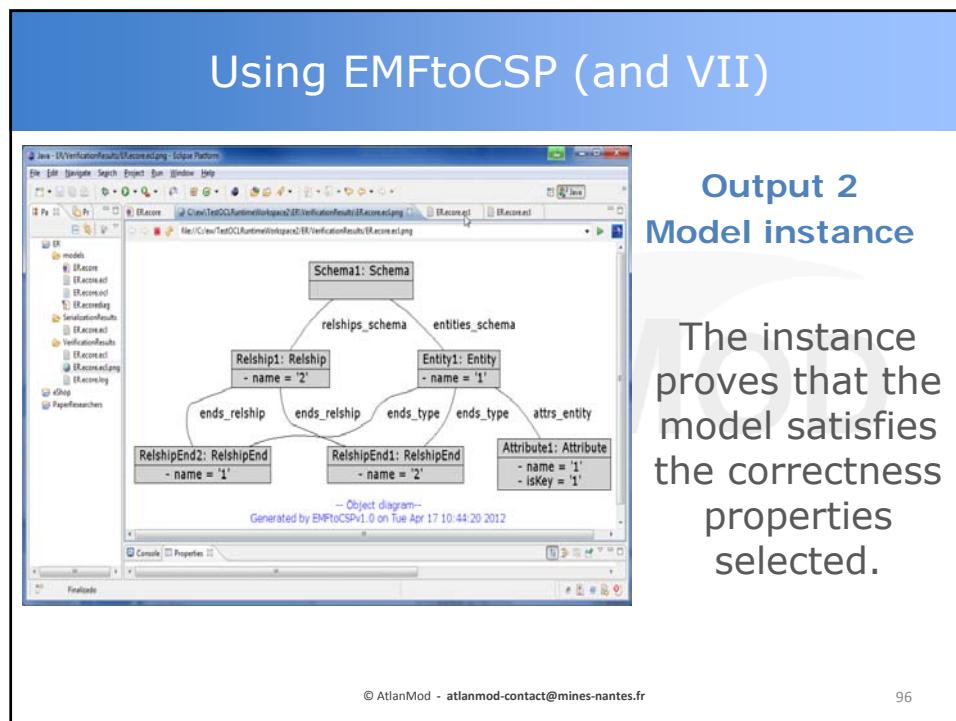

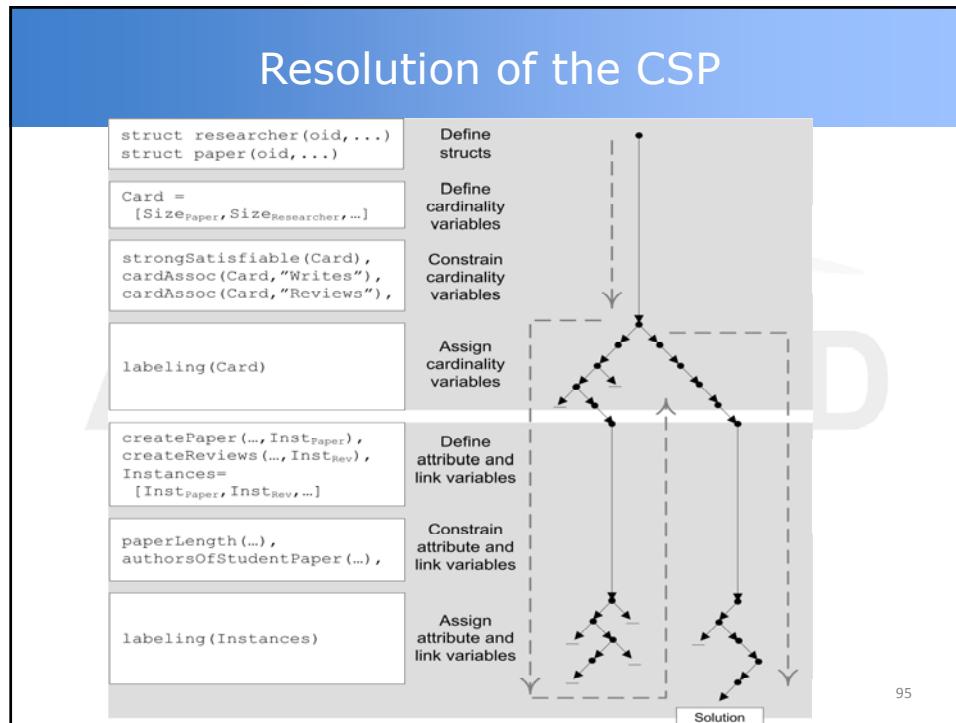

Using EMFtoCSP (VI)

**Output 1
CSP code**

It is possible to review the autogenerated CSP code, once the verification process ends.

© AtlanMod - atlanmod-contact@mines-nantes.fr 94

Translation of OCL invariants

context Paper **inv:** self.wordCount < 10000

- OCL invariant = instance of OCL metamodel
- Invariant becomes a **constraint** of the CSP

```

graph TD
    OC[OperationCallExp <] --- AC[AttribCallExp wordCount]
    OC --- IL[IntLiteralExp 10000]
    AC --- SE[VariableExp self]
  
```

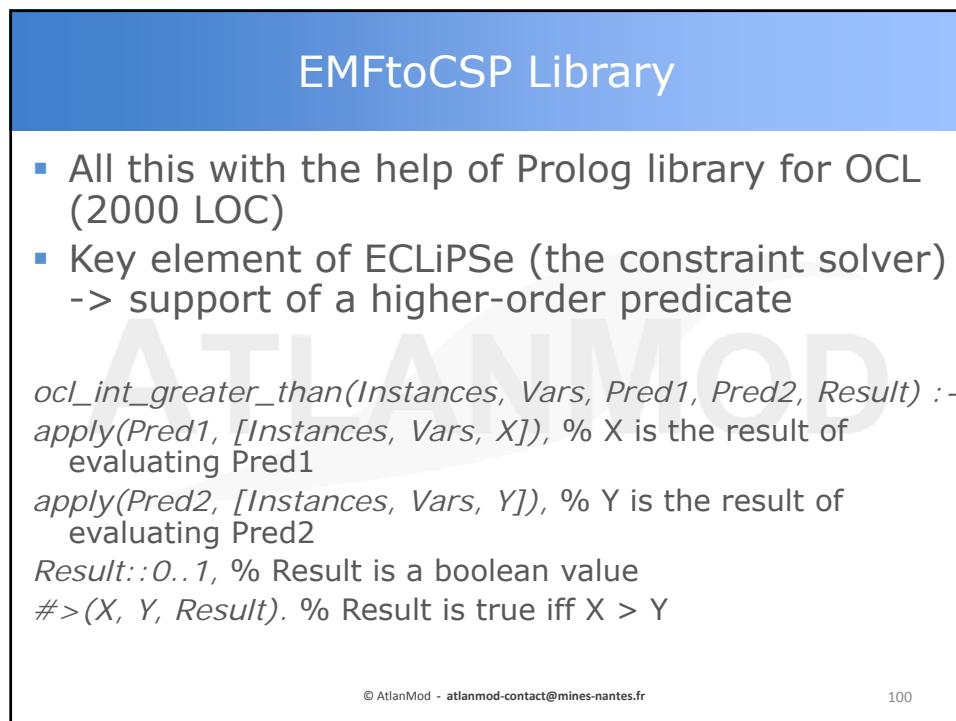

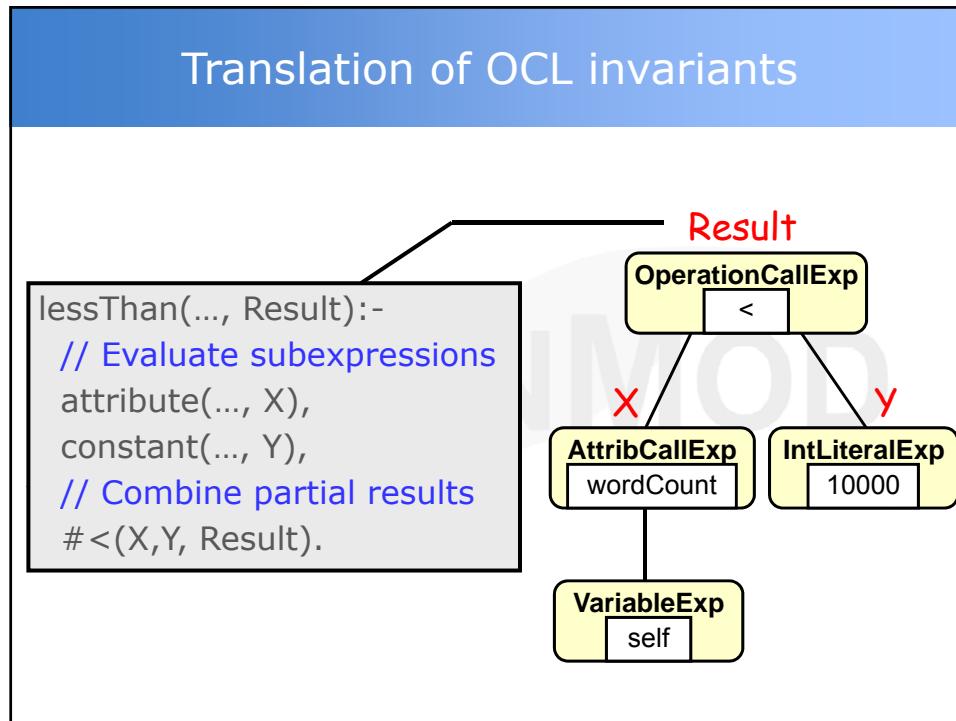

Translation of OCL invariants

attribute(Vars, X) :-
// Evaluate subexpressions
self(Vars, Z),
arg(Z, "wordCount", X).

Result

self(Vars, Z) :-
// Z is the only visible var
nth1(1, Vars, Z).

constant (Y):-
Y = 10000.

TOOLS – CODE GENERATION

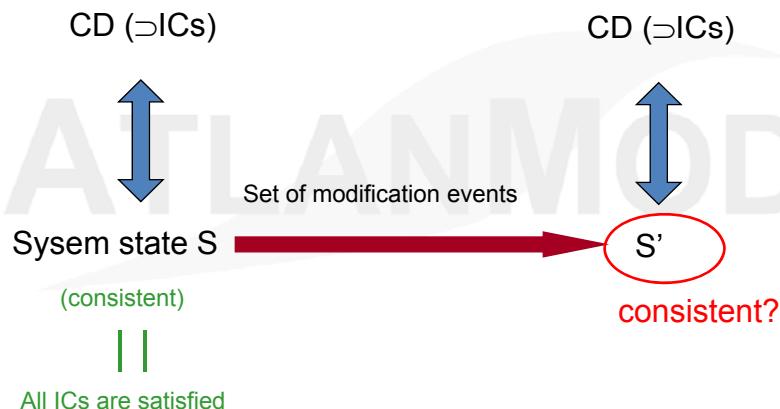

101

©

Code Generation for OCL expressions

- OCL expressions must be propagated to the system implementation
- Very very limited tool support for this (and not efficient – big scalability issues)
- Typically MDE tools limit validation to the input forms and/or provide a small DSL to express the rules they can enforce
- So, how would you implement OCL constraints?

The efficiency problem

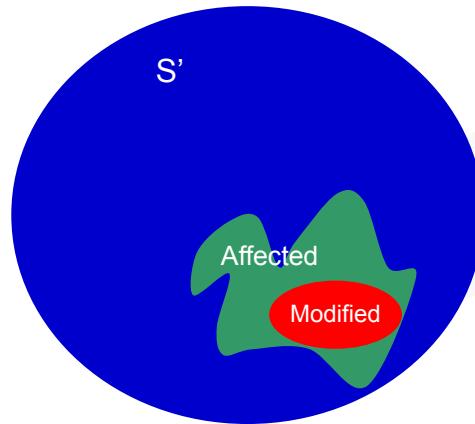

Goal

To propose a method to *efficiently* decide the consistency of S' wrt CD

Efficiency = Number of instances of State' that must be considered
when checking its consistency

- The method should be technologically independent
- Not bound to any technological assumption
- The results may be used to implement the CS in any platform

Efficiency (Incrementality) of a solution

- Since S was consistent, we may use the information about the applied events to avoid verifying the whole S' (checking *Affected* suffices)
- S' is consistent \leftrightarrow *Affected* is consistent
- The affected instances are the modified ones plus some other instances related with them

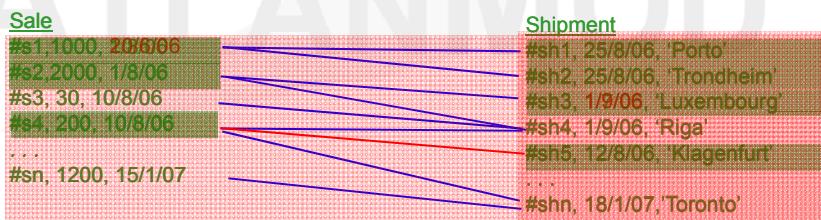

■ These kind of methods are referred as *incremental methods* (DB, as usual)

A simple example

context Sale inv: self.shipment->forAll(s)
s.plannedShipDate<=self.paymentDate+30

UpdateAttribute(sale, paymentDate, s20/06/06)

No relationship established by this piece of the context type

Code Generation

- The generated expressions may be used for code-generation methods to efficiently check the constraints in the final platforms

UpdateAttr(paymentDate, Sale)
Constraint ValidShipDate → *s.shipment->forAll(sh/*
sh.plannedShipDate<=s.paymentDate+30)

```
MethodX(Sale s,...)
{ ... s.paymentDate = value; ...
//Verification of expression 3
Iterator setsh = s.shipments.iterator();
while ( setsh.hasNext() )
{ Shipment sh = (Shipment) setsh.next();
  If (sh.plannedShipDate>s.paymentDate+30)
    throw new Exception("Invalid date");
}
}
```

```
create trigger uPaymentDate
before update of PaymentDate on Sale for each row
Declare v_Error NUMBER;
EInvalidDate Exception;
Begin --Verification of expression 3
  SELECT count(*) into v_Error
  FROM DeliveredIn d, Shipment sh
  WHERE d.sale = :new.id and d.shipment = sh.id
        and sh.plannedShipDate>:new.paymentDate+30;
  If (v_Error>0) then raise EInvalidDate; end if;
End:
```

The Modeling Portal

Modeling-languages.com + @softmodeling

Welcome to this Modeling Languages Portal – All you wanted to know about software modeling and model-driven engineering

Modeling is supposed to be one of the most important activities in any software development process. At least this is the general understanding within the software engineering research community. However, in the day-to-day practice, modeling is usually regarded as, basically, a waste of time. ... [More](#)

Our two papers accepted at MoDELS 2012

This year (well, also the last one) we got two papers accepted at the MoDELS 2012 conference. As usual, later on I'll publish a guest blog post for each paper but for those that can't wait, the titles, authors and abstracts of the papers are the following: On verifying ATL transformations using 'off-the-shelf'

OCL Workshp 2012

Co-located with MoDELS 2012

Welcome to the Homepage of the 2012 Workshop on OCL and Textual Modelling (OCL 2012)

September, 30th, 2012 - Innsbruck/AUSTRIA, Being part of the MODELS 2012 Conference.

Modeling started out with UML, and its precursors as a graphical notation. Such visual representations enable direct intuitive capturing of reality, but some of their features are difficult to formalize and lack the level of precision required to create complete and unambiguous specifications. Limitations of the graphical notations encouraged the development of text-based modeling languages that either integrate with or replace graphical notations for modeling. Typical examples of such languages are OCL, textual MOF, Epsilon, and Alloy. Textual modeling languages have their roots in formal language paradigms like logic, programming, and databases.

The goal of this workshop is to create a forum where researchers and practitioners interested in building models using OCL or other kinds of textual languages can directly interact, report advances, share results, identify tools for language development, and discuss appropriate standards. In particular, the workshop will encourage discussions for achieving synergy from different modeling language concepts and modeling language use. The close interaction will enable researchers and practitioners to identify common interests and options for potential cooperation.

The workshop continues a successful series of previous OCL workshops, most of them colocated to previous editions of the UML/MODELS conference. A list of all previous editions can be found via this link.

Appendix

OCL Standard Library

- OCLAny operations
- String operations
- Integer/Real operations
- Boolean operations
- Collection operations
- Iterator-based Collection operations

112 A small, yellow, stylized icon of a human figure with arms raised, positioned next to the number 112.

Appendix

OCLAny operations

Operation	Return value type
=	Boolean
<>	Boolean
<i>oclIsUndefined()</i>	Boolean
<i>oclAsType(type2)</i>	Objects of Type <i>type2</i> or <i>oclUndefined</i>
<i>oclIsTypeOf()</i>	Boolean
<i>oclIsKindOf()</i>	Boolean
<i>allInstances()</i>	Set(<i>T</i>)

113

Appendix

String operations

Operation	Notation	Return value type
concatenation	<i>s.concat(String)</i>	String
size	<i>s.size()</i>	Integer
to lower case	<i>s.toLowerCase()</i>	String
to upper case	<i>s.toUpperCase()</i>	String
substring	<i>s.substring(Integer, Integer)</i>	String
equals	<i>s1 = s2</i>	Boolean
not equals	<i>s1 <> s2</i>	Boolean

114

Appendix

Integer/Real operations

Operation	Notation	Return value type
plus	$a + b$	Integer/Real
minus	$a - b$	Integer/Real
multiplication	$a * b$	Integer/Real
division	a / b	Real
modulus	$a.mod(b)$	Integer
integer division	$a.div(b)$	Integer
maximum	$a.max(b)$	Integer/Real
minimum	$a.min(b)$	Integer/Real
round	$a.round()$	Integer
floor	$a.floor()$	Integer
absolute value	$a.abs()$	Integer/Real
equals	$a = b$	Boolean
not equals	$a <> b$	Boolean
less	$a < b$	Boolean
more	$a > b$	Boolean
less or equal	$a <= b$	Boolean
more or equal	$a >= b$	Boolean

115 

Appendix

Boolean operations

Operation	Notation	Return value type
or	$a \text{ or } b$	Boolean
and	$a \text{ and } b$	Boolean
exclusive or ¹⁾	$a \text{ xor } b$	Boolean
negation	$\text{not } a$	Boolean
implication	$a \text{ implies } b$	Boolean
if then else ²⁾	$\text{if } a \text{ then } b1 \text{ else } b2 \text{ endif}$	$\text{typeOf}(b1) = \text{typeOf}(b2)$
equals	$a = b$	Boolean
not equals	$a <> b$	Boolean

- 1) true, if either a or b is true, but not both are true at the same time
- 2) else-part is mandatory

116 

Appendix

Collection operations

Operation	Return value type
<i>count(object)</i>	Integer
<i>excludes(object)</i>	Boolean
<i>excludesAll(collection)</i>	Boolean
<i>includes(object)</i>	Boolean
<i>includesAll(collection)</i>	Boolean
<i>isEmpty()</i>	Boolean
<i>notEmpty()</i>	Boolean
<i>size()</i>	Integer
<i>sum()</i>	Integer/Real

117

Appendix

Iterator-based operations for Collections

Operation	Return value type
<i>any(exp)</i>	Object oder <i>oclUndefined</i>
<i>collect(exp)</i>	Bag(<i>T</i>)
<i>collectNested(exp)</i>	Collection(Collection(<i>T</i>))
<i>exists(exp)</i>	Boolean
<i>forAll(exp)</i>	Boolean
<i>isUnique(exp)</i>	Boolean
<i>iterate(...)</i>	beliebig
<i>one(exp)</i>	Boolean
<i>reject(exp)</i>	Collection(<i>T</i>)
<i>select(exp)</i>	Collection(<i>T</i>)
<i>sortedBy(exp)</i>	Collection(<i>T</i>)
